

NEW WITH OUR **LATEST VERSION**

k-eCommerce is continually adding new features, performance improvements, enhanced security and fixes to our e-commerce platform for a better-than-ever shopping experience for your customers and simplified web store maintenance for your team.

Here's a quick tour of some of our most exciting new features!

Content Delivery Network: Faster Site, Bigger Sales!

The Content Delivery Network (CDN) hosts heavy page elements like images and stylesheets, dramatically improving the speed of your web store's pages without sacrificing quality. It's incredibly easy to set up: you just have to enable it in your e-commerce configurations.

Form Builder

Create customized, interactive forms for your webstore with drop-down menus, text boxes, calendars... the works. Perfect for customer polls and surveys!

In-Stock Email Notifications

Let your customers know the second an item they're waiting for is back in stock with a "Notify Me" option on product pages that lets them register for an automated email.

10 New Web Store Page Templates

Optimize the flow of your web store's content with 10 diverse new page templates now available in the Content Management System (CMS).

New Default Themes

Give your web store a makeover with one of 5 new default themes. Choose from light or dark predefined schemes, and customize colors to fit your brand.

New Payment Profile Options

You can now configure the Bambora, Cybersource, and Moneris payment gateways to use payment profiles for your customers.

Customer Data and Tokenization

Create customer data profiles for sending invoices by email, developing marketing campaigns, and tokenizing sensitive payment information on our PCI-certified servers to simplify the order process for loyal customers.

Power Search Listing Lite

The advanced filtering capabilities of the Power Search now offer a streamlined results option that displays only one product per group, simplifying the shopping experience.

Improved Product Import/Export with Images

The product import/export feature now lets you import and export image URLs in every size, so you can double-check products without images, and reuse images for multiple products. Additionally, you may now define and view complementary and substitute products—as well as product kits—in batches.

And the best part?

All this is included, along with numerous other performance improvements and fixes, with the most recent version of **k-eCommerce!**
